

Calculate angles of a triangle worksheet

I'm not robot!

```

/*
 * C Program to calculate area of a
 * right angled triangle
 */
#include <stdio.h>
#include <conio.h>

int main(){
    float base, perpendicular, area;
    printf("Enter base of right angled triangle\n");
    scanf("%f", &base);
    printf("Enter perpendicular of right angled triangle\n");
    scanf("%f", &perpendicular);
    /* Area of right angled triangle =
     (Base X Perpendicular)/2 */
    area = (base * perpendicular)/2;
    printf("Area of triangle : %.4f\n", area);

    getch();
    return 0;
}

//Site : BTechgeeks.com

```

The Law of Cosines

$$\cos C = \frac{c^2 - a^2 - b^2}{-2ab}$$

$$A^\circ + B^\circ + C^\circ = 180^\circ$$

$$c^2 = a^2 + b^2 - 2ab \cos C$$

Finding Types of Triangles Worksheet

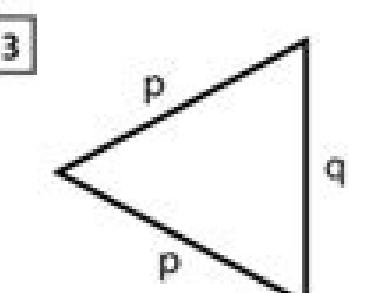

Identify the type of each triangle as equilateral, scalene or isosceles

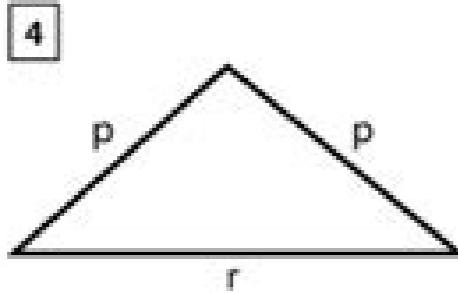

Solved

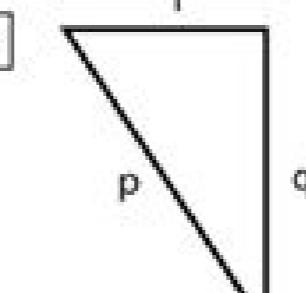

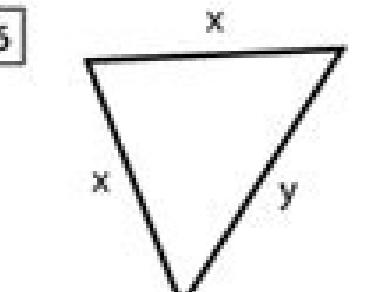

Equilateral Triangle

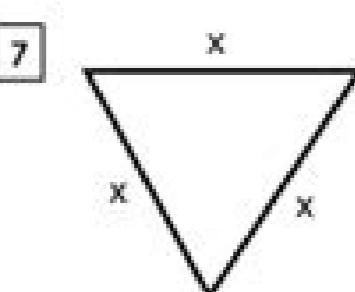

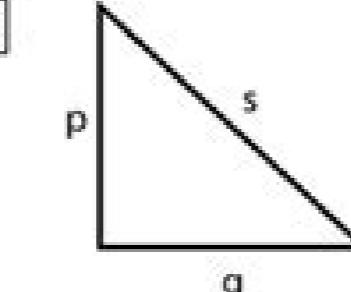

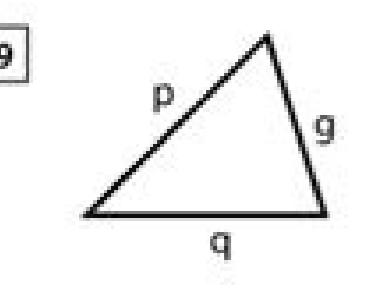

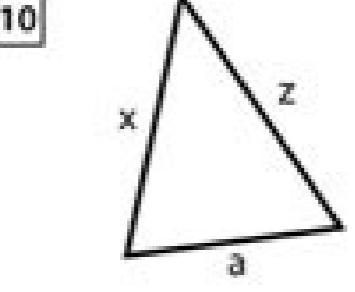

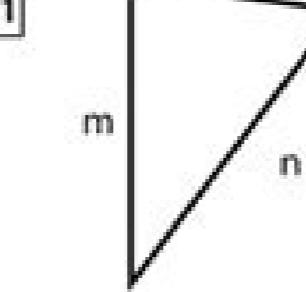

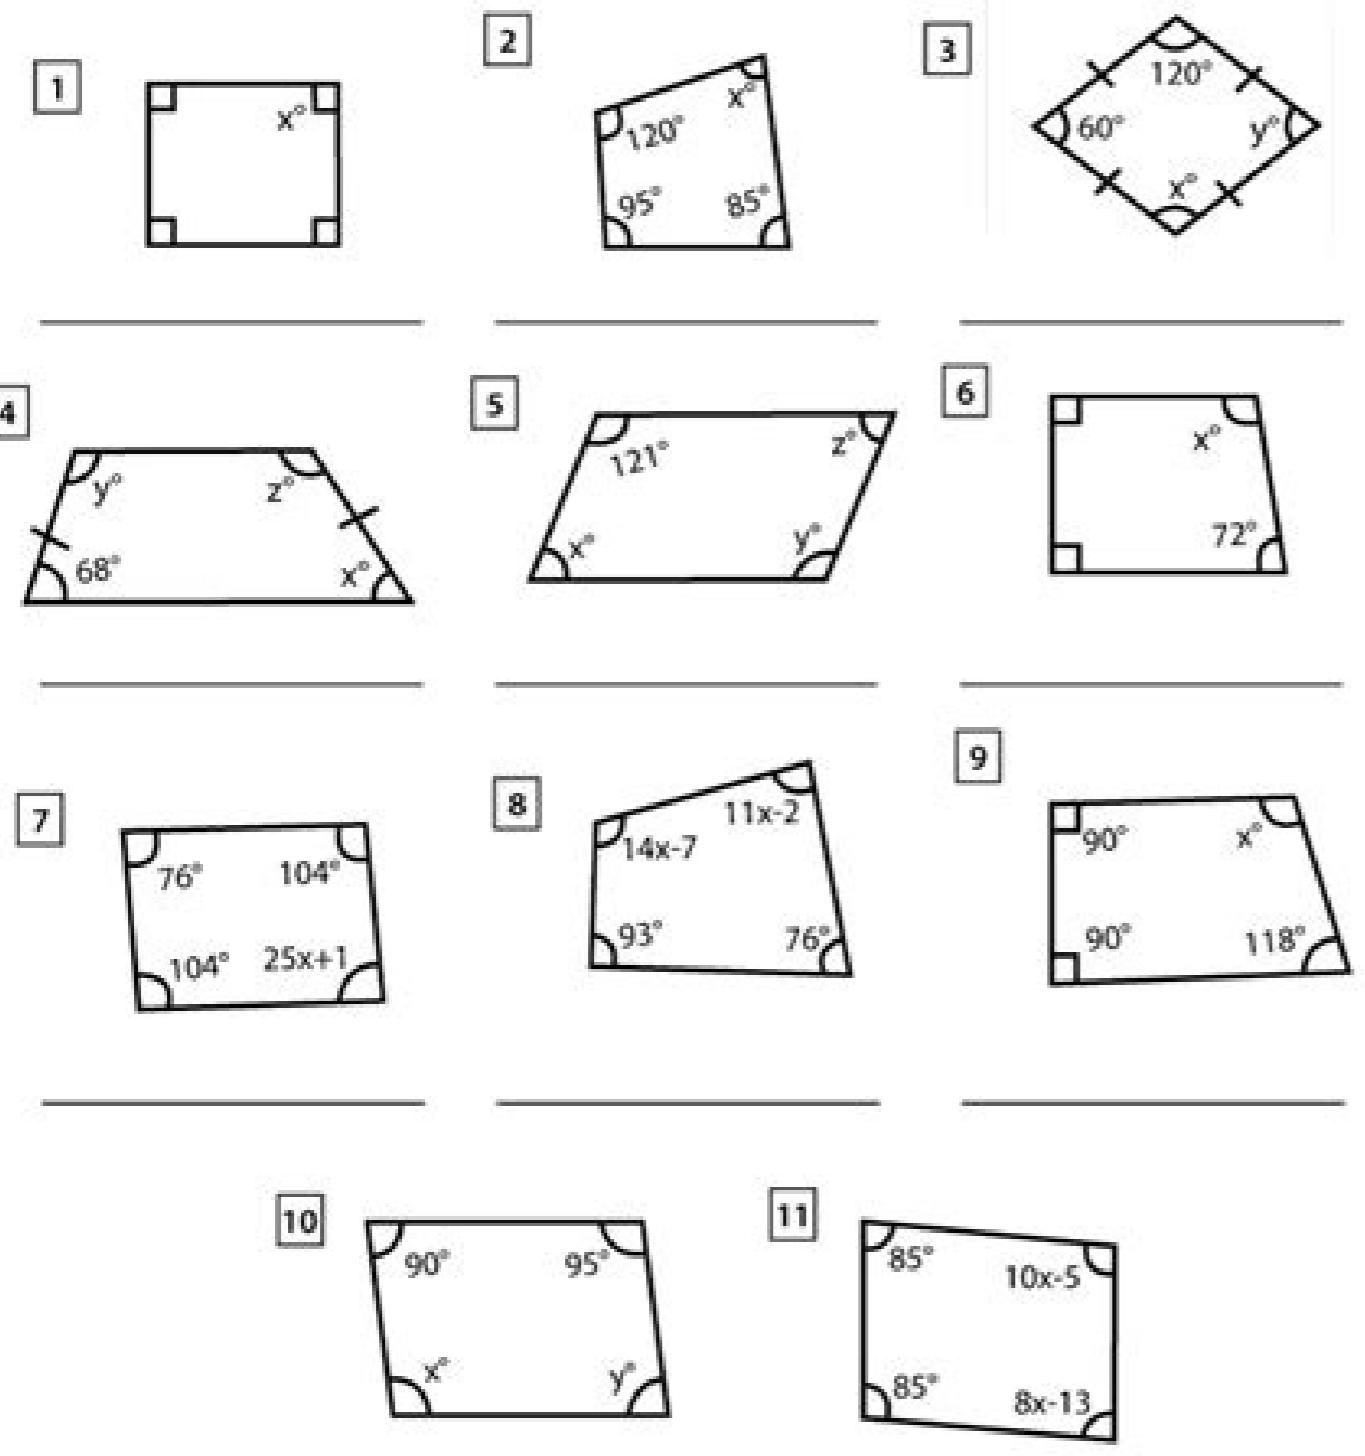

Angle of Elevation & Depression

$$\tan \theta = \frac{h}{x}$$

$$\theta = \tan^{-1}\left(\frac{h}{x}\right)$$

Finding missing Angle(s) of a Quadrilateral Worksheet

Find the measure of each unknown angle

How find the angles of a triangle. Calculate the angles of a triangle worksheet. How do i calculate angles in a triangle. How to find angles of a triangle in a triangle. How to find the angle of a triangle calculator.

These free geometry worksheets will introduce you to the Triangle Sum Theorem, as you find the measurements of the interior angles of a triangle. The interior, or inside, angles of a triangle always add up to 180 degrees. In addition to your geometry skills, you'll be able to polish your algebra skills as you set up and solve equations on some of the tougher triangles. That's one great way to check your answer on these exercises, if the sum of your angles is 180, then you got 'em all correct. Sum of the Interior Angles of a Triangle Worksheet 1 - This angle worksheet features 12 different triangles. The measures of two angles are given and the third angle measurement is unknown. Sum of the Interior Angles of a Triangle Worksheet 1 RTF Sum of the Interior Angles of a Triangle Worksheet 1 PDF View Answers Sum of the Interior Angles of a Triangle Worksheet 2 - This angle worksheet features 12 different triangles. The measure of one angle is given, the other two angles are represented by algebraic expressions like $5x$ and $x + 7$. You can solve these problems in a variety of ways, my favorite is to set up and solve an equation that's equal to 180, like $5x + x + 7 + 75 = 180$. Sum of the Interior Angles of a Triangle Worksheet 2 RTF Sum of the Interior Angles of a Triangle Worksheet 2 PDF View Answers Sum of the Interior Angles of a Triangle Worksheet 3 - This angle worksheet features 12 different triangles. The measure of each angle is represented by an algebraic expression. That's right, you're not give the measure of any of the three angles in the triangle. If you paid attention on the previous worksheet, this one should be a piece of cake! Sum of the Interior Angles of a Triangle Worksheet 3 RTF Sum of the Interior Angles of a Triangle Worksheet 3 PDF View Answers I regularly upload resources that I have created during 30 years as a teacher. Most of these are maths, but there are some ICT/Computing and Tutor Time activities. All of the resources are my own and are not available from third-parties. The resources have been tweaked over time and I have had many happy lessons and shed-loads of happy and successful students. At the end of 2017 the TES announced that I was the most downloaded new author and in 2018 another 2 million were added to the count. Last updated 16 January 2019 Three differentiated worksheets (with solutions) that allow students to take the first steps, then strengthen and extend their skills in working with angles in triangles. Click [tes.com/.../worksheets...](#) to download similar style worksheets on other topics. These worksheets are great to use in class or as a homework. They are also excellent for one-to-one tuition and for interventions. This download includes a special PowerPoint which allows individual questions to be enlarged and answers to questions to be revealed one at a time. If you like this resource, then please rate it and/or leave a comment. If the rate-resource button on this page doesn't work, then go to your ratings page by clicking [www.tes.com/.../rate-resources...](#) Creative Commons "Sharealike" Select overall rating (no rating) Your rating is required to reflect your happiness. Write a review Update existing review It's good to leave some feedback. Something went wrong, please try again later. Thank you for sharing these sheets. They are perfect for differentiating in the classroom. I give my students the opportunity to decide where to start with the resources. Some students start at the first level and then move on to the harder problems - when they would have not tried the harder problems if presented with them first. The extend level problems are very challenging for my year 7 students and really make them work - but then they feel so good when they get them out. Some will take 45 minutes to answer one question. They also allow students to work together and collaborate to find solutions to the challenge problems. Empty reply does not make any sense for the end user thank for sharing these sheets. Perfect for consolidating the work that we have been doing on angles in triangles. Like the potential for extension provided as well. Empty reply does not make any sense for the end user GreatEmpty reply does not make any sense for the end user Excellent materialsEmpty reply does not make any sense for the end user Good differentiation, solutions very handy too. I would like to see some reasons with the answers, though I can see space is limited. Empty reply does not make any sense for the end user Report this resource to let us know if it violates our terms and conditions. Our customer service team will review your report and will be in touch. Math worksheets and visual curriculum Live worksheets > English Finish!! Please allow access to the microphone Look at the top of your web browser. If you see a message asking for permission to access the microphone, please allow. Close Here is everything you need to know about angles in a triangle including what the angles in a triangle add up to, how to find missing angles, and how to use this alongside other angle facts to form and solve equations. There are also angles in a triangle worksheets based on Edexcel, AQA and OCR exam questions, along with further guidance on where to go next if you're still stuck. All triangles have interior angles that add up to 180° . Angles in a triangle are the sum (total) of the angles at each vertex in a triangle. We can use this fact to calculate missing angles by finding the total of the given angles and subtracting it from 180° . This is true for all types of triangles. Right Angle Triangle: One 90° angle, the other two angles will have a total of 90° . Isosceles Triangle: Two equal sides and angles. Equilateral Triangle: All three angles are 60° . Scalene Triangle: All three angles are different. Examples: In order to find the missing angle in a triangle: Add up the other angles within the triangle. Subtract this total from 180° . Get your free angles in a triangle worksheet of 20+ questions and answers. Includes reasoning and applied questions. DOWNLOAD FREE x Get your free angles in a triangle worksheet of 20+ questions and answers. Includes reasoning and applied questions. DOWNLOAD FREE Work out the size of the angle labelled a in the following triangle. We are given the angles 57° and 79° . Add these together. $2\text{Subtract } 136^\circ \text{ from } 180^\circ. [180 - 136 = 44^\circ]$ Find the angle labelled b in the following triangle. We are given the angles 90° and 19° . Add these together. $[90 + 19 = 109^\circ]$ Subtract 109° from 180° . Find the angle labelled c in the following triangle. When two sides of a triangle are equal, the angles at the ends of those sides will also be equal. We are given the angle 64° . As this is an isosceles triangle (two equal length sides and two equal angles), the other angle at the bottom will also be 64° . Subtract 128° from 180° . Subtract the given angle from 180° . Divide by 2. Find the size of the angle labelled d in the triangle below. This is an isosceles triangle. We are given one angle and asked to find one of the remaining two angles, which we know are equal. The other two angles in this triangle are equal, we can find d by dividing by 2. Sometimes the problem will involve using other angle facts. Let's recap some of the other angle facts we know: Use angle facts to fill in any possible angles. Use these angles to calculate missing angles in the triangle. These steps are interchangeable and may need to be repeated for more difficult problems. Find the size of the angle labelled e. Here we can use the fact that angles at a point add up to 360° . Now we know two angles within the triangle, we can find the missing angle. This time we already know two of the angles in the triangle so we can start by finding the third angle. We can use the fact that opposite angles are equal to find f. Find the size of the angle labelled g. We know two of the angles in the right hand triangle and so we can calculate the third. We can use the fact that angles on a straight line add up to 180° . Since the sides of the triangle are equal, the left hand triangle is an isosceles triangle and the two angles at the bottom of the triangle are equal. Therefore we can work out the third angle. We can use the fact that the angles in a triangle add up to 180° to form equations which we can then solve to find the values of the angles in the triangle. Add together the expressions for each angle and simplify. Put the simplified expression equal to 180° . Solve the equation. Substitute your value back in to find the angles in the triangle. Add the expressions for each angle. Put the simplified expression equal to 180° . $\begin{array}{l} 2 \times 20 = 40 \\ 3 \times 20 = 60 \\ 4 \times 20 = 80 \end{array}$ The three angles are 40° , 60° and 80° . Find the size of each angle in this right-angled triangle. Add the expressions for each angle. $[3i + 25 + 2i - 5 + 90 = 5i + 110]$ Put the simplified expression equal to 180° . $\begin{array}{l} 3 \times 14 + 25 = 67 \\ 2 \times 14 - 5 = 23 \end{array}$ The three angles are 23° , 67° and 90° . Using 360° instead of 180° for the sum of the angles of the triangle. Equal angles in an isosceles triangle Selecting the wrong angles when identifying the equal angles in an isosceles triangle (particularly a problem when the equal angles are not at the bottom). The angle that is different in an isosceles triangle is the one between the two sides with equal length. Practice angles in a triangle questions $90+57=147$ $180-147=33^\circ$ This is an isosceles triangle and the two angles on the right are equal. $180-42=138$ $138 \div 2 = 69^\circ$ All three angles in an equilateral triangle are equal so $180 \div 3 = 60^\circ$ The angle opposite 24° is also 24° since vertically opposite angles are equal. The triangle is an isosceles triangle and the two angles on the left are the same size. $180-24=156$ $156 \div 2 = 78^\circ$ Looking at the left hand triangle first, we can find the missing angle in that triangle: $90+39=129$ $180-129=51^\circ$ We can then use the fact that angles on a straight line add up to 180° to find the unlabelled angle in the right hand triangle: $180-51=129^\circ$ We can then find angle v: $129+31=160^\circ$ $180-160=20^\circ$ 176° , 112° , 76° , 102.5° , 72.5° , 46.25° , 86° , 56° , 38° , 48° , 34° Adding the expressions gives us: $2u+20+2u-10+u+5=5u+15$ Therefore $5u+15=180$ $5u=165$ $u=33^\circ$ $2 \times 33+20=86^\circ$ $2 \times 33-10=56^\circ$ $33+5=38^\circ$ Angles in a triangle GCSE questions 1. Find the size of angle x given that the exterior angle shown is 153° . (2 marks) $180-153=27^\circ$ (1) $90 + 27 = 117$ 180-117=63 $^\circ$ (1) 2. (a) Calculate the size of angle ACE. (5 marks) (a) $90 + 36 = 126$ 180-126=54 $^\circ$ (1) (b) Angle CBD : $= 180 - 117 = 63^\circ$ Angle BDC : $63 + 54 = 117$ 180-117=63 $^\circ$ (1) Two angles equal therefore isosceles (1) 3. Work out the size of the smallest angle in the right angled triangle. (4 marks) $3x - 10 + 2x + 55 + 90 (= 5x + 135)$ (1) $5x + 135 = 180$ (1) $x = 9$ (1) 3 \times 9-10=17 $^\circ$ (1) You have now learned how to: Use the sum of the angles of a triangle to find missing angles Apply other angle facts to find missing angles in triangle problems Form and solve equations using the sum of the angles in a triangle Angles in parallel lines Pythagoras' theorem Congruent shapes Prepare your KS4 students for maths GCSEs success with Third Space Learning. Weekly online one to one GCSE maths revision lessons delivered by expert maths tutors. Find out more about our GCSE maths revision programme.
