Distribution of interval BC prognostic characteristics did not differ between screening modalities except that those occurring in DBT-screened participants were significantly more likely to be negative for axillary-node metastases ( $P = 0.005$ ). Although heterogeneity in ICR estimates and few datasets limit recommendations, there was no difference between DBT and mammography in pooled ICR despite DBT increasing cancer detection. Digital breast tomosynthesis June 20, 2017 38th BCS Examination 2017 Circular Bangladesh Civil Service has invited application from the eligible candidates and published a circular. According to the circular there are 2024 empty posts of different cadre. BCS General Cadre posts number = 520 BCS Technical / Professional Cadre posts number = 549 BCS for general Govt. Comparative screening sensitivity was calculated using screen-detected and interval BC data. Four prospective DBT studies, from European population-based programs, contributed IPD for 66,451 DBT-screened participants; age-adjusted pooled ICR was 13.17/10,000 (95%CI: 8.25–21.02). We estimated ICR for DBT-screened participants and the difference in pooled ICR for DBT and mammography-only screening, and compared interval BC characteristics. The ICR in the pool was higher in high density (21.08/10,000; 95%CI: 6.71–66.27) than in low density groups (8.63/10,000; 95%CI: 5.25–14.192) ( $P = 0.03$ ) however estimates did not differ between age groups ( $P = 0.32$ ). 38 ° BCS application start date = 10/7/17 morning 10:00 Application Deadline = 10/8/17 evening 18:00pm Number of college messages = 839 4. Based on two studies that also provided data for 153,800 mammographic screens (age collection 17.69/10,000; 95%CI: 13.22–23.66), the DBT collection was 16.83/10,000 (95%CI: 11.89–23.82). ICR's two-stage metaanalysis (specific estimate for study, pool synthesis) included random effects, adjusting for study and age, and was estimated at age and density subgroups.
